

Gentlemen,

I would like to encourage careful consideration of 04-29, BPL. Technical reports I have seen to date all indicate various levels of interference due to BPL with existing radio services. I believe the most important issues are two:

1. The obliteration of useful radio communication due to BPL interference.
2. The general raising of the noise baseband contributed by BPL service.

I think the commission should be very cautious in deciding this issue and err on the side of caution even if it means to disallow BPL. I think the interference issues have the potential to overwhelm the enforcement and litigation arms of the commission. Also, primary uses may render the BPL ineffective and result in complaints from BPL users.

Thank you,
-Bernie Miller
